SET INSTRUCTIONAL PRIORITIES

Research and Develop Potential Instructional Priorities

SUMMARY

Prerequisite Best Practices:

- Best Practice in School Budgeting, 2A – Develop Goals
- Best Practice in School Budgeting, 2B – Identify Root Cause of Gap between Goal and Current State

Key Points

- To close the gap between its current and desired state, a school district should research practices shown to improve district performance to determine which practices might help it plan, budget, and attain its student achievement goals.
- Some of these proven practices include: provide an effective teacher in every class and an effective principal in every school; develop systems to collect relevant data for decision making; adopt effective instructional and curriculum programs; offer additional instructional time for struggling students; and leverage outside resources.
- Based on its research into what has worked elsewhere, a district should identify a limited number of instructional priorities it may wish to adopt. An instructional priority is an overall approach for overcoming the challenges the district faces and achieving its goal. An instructional priority should be clear about its intent, articulating the presumed cause-and-effect relationships between the actions the district will take and the outcomes for student achievement. However, it should not be specific with regard to implementation details. To promote focus, a district should limit the number of instructional priorities it adopts to the most critical things it can do to improve performance.

Related Award Program Criteria

- **Criterion 2.C.1: Instructional Priorities (Mandatory).** The applicant has developed a set of instructional priorities as demonstrated by the presentation of the instructional priorities in the supplementary materials. The applicant can provide research citations and/or other research to support the development of the instructional priorities in the supplementary materials. Note that the applicant does not necessarily have to use the term “instructional priorities” in its budget process or document — any term is acceptable as long as the underlying concept is met.
Introduction

After a school district has developed a set of SMARTER goals, identified gaps between the desired goal state and the district’s current condition, and performed root cause analysis on those gaps, it must find ways to close those gaps. The starting point is to research programmatic, organizational, talent management and/or revenue practices that have proven effective elsewhere for improving student achievement. Such research helps maximize a district’s chances of making meaningful improvements in student achievement and using scarce resources most effectively.

Based on its research, a district should identify the particular programmatic, organizational, talent management, and revenue practices that it wants to implement - termed the district’s “instructional priorities”. Each of these instructional priorities represents an overall approach for overcoming the problems highlighted by the diagnosis of root causes. An instructional priority provides direction without specifying exactly which actions should be taken.

This best practice document describes:

I. Existing research on proven effective practices that a district should consider as it develops its instructional priorities
II. How to articulate instructional priorities

I. Research on Effective Practices

Background. A district’s budgeting process must identify potentially effective practices to improve student achievement so that these practices can be supported by action planning and budget allocations. This begins by starting the budgeting and planning process early enough and/or coordinating with other related initiatives so that there is time to perform research and consider new ways of reaching student learning goals. Research into new and effective practices must also be rooted in an understanding of where the district is underperforming and the root causes of the underperformance. This helps focus research and consideration of new practices on the areas that matter most.

Finding Other Practices

It is likely that a district will need to identify new practices beyond those documented here. For example, it may need a new scheduling practice or it may need to look for new revenue sources. Districts are encouraged to network with peers, consult professional journals and associations, and take other steps to find ideas where they are needed.

Recommendation. This document describes a number of practices that have been proven effective by professional researchers. Districts should reflect on these practices and determine the role that they might play in the district’s plan and budget for improving student achievement.

Provide an Effective Teacher in Every Class and an Effective Principal in Every School

Teachers are the most important element in a student’s learning experience at school and principals are also a critical element in the student’s learning experience. Hence, top talent is required to achieve the best possible gains in student achievement. The practices below have been shown to support teacher and principal effectiveness.

- Manage talent carefully. Ensuring a high quality teaching staff starts with recruiting from effective talent training institutions and organizations and also offering competitive compensation. Additionally, districts must continue to manage the quality of their workforce after the initial hire; using tools like performance appraisals, feedback systems, and distributing teacher talent among schools fairly. Policies for tenure, promotion, pay, and dismissal that rely on proven metrics from new teacher and principal evaluation systems should also be in place.
What Else Works?

The What Works Clearing House (www.ies.ed.gov/ncee/wwc) and the Best Evidence Encyclopedia (www.bestevidence.org) identify curriculum programs in many subject areas that have significant and positive learning effects.

- **Provide time for teachers to work and plan collaboratively.** “Central to the success of high-achieving schools is a collaborative culture focused on teaching and learning. This culture supports regular meetings of teachers who share responsibility for assessing needs and developing solutions that address all students’ learning” — according to school researcher Alan Blankstein. Hence, providing the resources for teachers to work collaboratively should be a central part of a district’s improvement strategy. Researcher-recommended minimums for collaborative time range from 90 total minutes per week to three 45-minute periods (135 minutes total) per week. The time can be used for a variety of purposes, including curriculum planning, professional practice and study forums, developing teaching strategies, or peer observation.

- **Professional development makes a real contribution to teacher quality.** Although “just about all teachers have been subjected to professional development in some form or another... the emphasis on the quality of professional development is what distinguishes [high performing schools]” as pointed out by school researcher Karin Chenoweth. However, quantity does not equate to quality in professional development. High-quality professional development exhibits the following characteristics:
  - Training is centered on the curriculum being taught and based on the curriculum and instructional materials created by collaborative teams (see above). The training is also based on the analysis of student performance data, and is linked to larger instructional improvement strategies for the district or school.
  - Dedicated instructional coaches work with teams of teachers to get new instructional practices embedded into classrooms.
  - New hires (both new and experienced teachers) are trained in essential skills.

**Collect and Analyze Data**

The foundation for good decision making is good data. A district should develop systems to collect relevant and timely data, and the district should cultivate the capacity in staff to successfully analyze and use the data for decision making.

With respect to data collection methods, a district should develop methods to perform diagnostic, formative/short-cycle (i.e., feedback), and summative (i.e., review) assessments. Formative/short-cycle assessments are perhaps the most important because they provide the most immediate feedback. While standardized test scores can be useful, districts and teachers should track a broader set of data to get a more complete picture of performance. These data could include absentee rates; dropout rates, suspension and disciplinary rates; report card grades; high school graduation rates; measures of college and career readiness (e.g., SAT/ACT scores, percent of students taking advanced placement courses); and demographic and socioeconomic information. Surveys and observations are also useful for capturing human judgments and opinions that may not be included in formal record keeping.

Even the most robust data collection system will fail to make an impact if the data are not used correctly to make decisions. Hence, training and capacity building to use data are essential. Data analysis is particularly powerful when it takes place in collaborative, team settings where staff analyze student work together based on common assessments or assignments.

**Adopt Effective Instructional and Curriculum Programs**

“Most improving schools adopt new curriculum programs and over time identify a set of effective instructional practices to implement the new program” — according to school researchers Allan Odden and Lawrence Picus. Further, specific curriculum programs may have much higher impacts on student learning than other curriculum programs and other educational reforms. Examples of effective practices in instructional and curriculum design include:

- **Use common instruction.** Districts should use a common curriculum for core subjects (e.g., reading, science, math) across all schools in the district. A common curriculum facilitates the ability of teachers to work collaboratively and to share experiences and materials.
Readers may have noticed the absence of the word “strategy” to label the practices described in this document. This is because a practice such as “following National Reading Panel guidelines” is not a strategy. It is only a strategy when it addresses a root cause of underperformance at a particular district or school and when it is accompanied by the necessary action plans and resources to implement the practice. The other Best Practices in School Budgeting describe how practices become implementable strategies through the budget process.

**Strategy and Implementation?**

Follow National Reading Panel guidelines. The National Reading Panel (NRP) was formed by the federal government to assess the status of research-based knowledge about reading, including the effectiveness of various approaches to teaching students to read. The NRP identified a number of instructional strategies that are very promising for teaching students with reading difficulties.16

Be strategic and intentional about core and elective classes. While elective classes are an important, enriching experience for students, districts must be cautious that the well-intended desire to offer such classes does not crowd out time or money for core classes. For example, researchers at the Center on Reinventing Public Education calculated the cost per-pupil to offer core and elective courses at one district and found that per-pupil staffing costs averaged $512 per elective course, but only $328 per math class.17 Districts should understand how resources are allocated between core and elective courses and make sure that this allocation is a result of strategic and intentional decision making.

Give Students Who Struggle Additional Instructional Time

“If schools have no choice other than special education for struggling learners, students may be over-diagnosed into this expensive model, one that may not be well suited to providing accelerated academic instruction” — according to the nonprofit organization Education Resource Strategies.18 Therefore, districts should devote resources to providing extra attention to struggling students as a more cost and academically effective alternative.19 Response to intervention (RTI) is one highly regarded approach to providing “just in time” intervention. RTI models emphasize ongoing identification and response-to-learning needs of struggling students before they are placed into special education programs. In an RTI model, student learning is continuously monitored and interventions are continuously refined based on the student’s learning response.20 Some of the options for providing additional instructional time for students who are identified as in need of assistance include individual or small group tutoring, before and after school supplementary classes, and summer school.

Leverage Outside Resources

Engagement with parents and the community is an important ingredient for student success. School districts should strive to increase the level of parental and community engagement.21 For example, the National PTA promulgates national standards for family involvement programs that can be reflected in how districts run their budgeting process. There are also many opportunities to work with community groups or nonprofits that can extend and enhance the programs offered to students.22

**Not all Leading Practices have a Relation to the Budget**

Not all characteristics of high-performing schools will necessarily have a close link with the budget process. For example, Karen Chenoweth cites a number of features of high-performing schools that would not have close relationship with the budget process, such as maximizing the use of the time students have in school, establishing an atmosphere of mutual respect between all members of the learning community, and building sustainable leadership capacity and trust.23

**II. Articulate Instructional Priorities**

**Background.** A district’s instructional priorities are a comprehensive approach for achieving goals and overcoming the problems uncovered by a district’s root cause analysis. Instructional priorities should articulate a clear direction for the district without being overly specific on the exact action steps to be taken.
In addition, a district’s instructional priorities will guide action planning and budget allocations. Note that in a budgeting process where much budgetary decision-making authority has been given to individual school sites, it would be necessary for each school site to develop its own instructional priorities.

**Recommendation.** While a variety of formats and approaches are acceptable, a district’s instructional priorities should have the following key characteristics:

- **Be clear about intent.** The district should be clear about how each instructional priority it develops will improve student achievement. This clarity of intent will be helpful in the future if the district needs to prioritize the instructional priorities against each other.

- **Do not be overly specific on implementation details.** Leaving out the implementation details allows decision makers to more easily consider the big picture of how various instructional priorities might fit together or conflict. Also, it prevents the process from becoming bogged down in disagreements over implementation details, which can be settled later in the planning and budgeting process.

- **Articulate presumed cause-and-effect relationships.** An instructional priority should describe the assumed mechanism by which it will help the district meet its goals. A shared, explicit understanding of the assumed cause-and-effect relationship at work forms a powerful foundation for budgeting as it becomes the basis for deciding which uses of the district’s limited funds have the most potential.

- **Limit the number of instructional priorities.** A school district needs to maintain focus when planning to improve student achievement. Developing too many instructional priorities will dilute this effort.

**Endnotes**

3. In a 2010 Wallace Foundation survey, school and district administrators, policymakers, and others identified principal leadership as among the most pressing matters on a list of issues in public school education. Teacher quality stood above everything else, but principal leadership came next, outstripping other subjects, including dropout rates, STEM (science, technology, engineering and math) education, student testing, and preparation for college and careers. See Linda Simkin, Ivan Charner, and Lesley Suss, Emerging Education Issues: Findings from the Wallace Foundation Survey, prepared for The Wallace Foundation by the Academy for Educational Development, unpublished (2010), 9-10.
4. These are examples of practices followed by high-performing districts, as described by Karin Chenoweth, It’s Being Done: Academic Success in Unexpected Schools (Cambridge, MA: Harvard Education Press, 2010).
5. Many researchers have found that inequitable distribution of teacher talent between schools is often a problem in school districts, where veteran teachers are over-represented in certain schools (typically the ones with student populations that are considered easier to teach). See for example Marguerite Roza, Educational Economics: Where Do School Funds Go? (Washington, D.C.: Urban Institute Press, 2010).
6. Researchers Anthony Bryk and Barbara Schneider point out that “a school that tolerates manifest gross incompetence in a few teachers can be highly corrosive to the collective efforts toward improvement being made by others.” See Anthony Bryk and Barbara Schneider, Trust in Schools: A Core Resource for Improvement (New York: Russell Sage Foundation, 2002).
7. Alan Blankstein’s views are supported by other researchers including Odden and Picus, and Chenoweth. Blankstein also cites a number of other sources. See Blankstein, Failure is Not an Option (Thousand Oaks, CA: Corwin-Sage, 2013).
10. Chenoweth, It’s Being Done.
For example, districts may wish to survey students on their views of the academic environment of their schools or on perceptions of safety in the schools. Blankstein, *Failure is Not an Option*.

The National Reading Panel prepared the results of its research in two reports and a video titled, “Teaching Children to Read.” See www.nationalreadingpanel.org.

The researcher’s work suggests that these findings are not anomalous, but represent a common pattern. See Marguerite Roza, “Now is a Great Time to Consider the Per-Unit Cost of Everything in Education,” in *Stretching the School Dollar*, ed. Frederick M. Hess and Eric Osberg (Cambridge, MA: Harvard Education Press, 2011).

This strategy is supported by a number of school researchers, including Educational Resource Strategies, Chenoweth, Odden, and others.

Description of RTI taken from “School Design,” Educational Resource Strategies. Note that response to intervention is sometimes also abbreviated RtI or RTI to denote different approaches to response to intervention. GFOA uses “RTI” in a generic sense and does not advocate for one particular approach over another.

For a fuller description of how to engage the community in school activities, see Blankstein, *Failure is Not an Option*.

For example, at one school a partnership with the nonprofit organization provided a trained coach who managed six periods of recess and physical education each day. Previously, special education teachers had staffed these periods. As a result of the partnership, the school improved the quality and reduced the cost of valuable physical activity time for young students and better deployed special education teachers to focus on their specialties. Taken from Chris Gabrieli, “TIME— It’s Not Always Money,” *Educational Leadership* (January 2012).

This idea is a more recent entry into public-sector budgeting, but has been supported by the success of budgeting methods such as budgeting for outcomes.
